

Flexile has provided both infrastructure and communications solutions to all types of health care providers for many years. The health care industry often requires the ability to extend care to remote areas, while maintaining secure access to central information. This divergence has necessitated the use of video conferencing, virtual private networking, and private wide area networks to build secure and responsive solutions.

In addition to the technology solutions, health care providers need maintenance and support to ensure the technology is available when necessary. Flexile has always stressed user friendly proven technologies. If something is difficult to use or unreliable, it will not be an effective tool for busy professionals with critical responsibilities.

The health care marketplace can use many of the technology solutions offered by Flexile:

- Video conferencing carts and rooms
- Multimedia training and meeting rooms
- Wide area networking with virtual private connectivity
- Cabling and equipment infrastructure
- Enterprise Microsoft application servers
- Wireless communications
- Voice over IP communications
- Support and service contracts

Some of the needs that have been addressed by these technologies include:

- Doctor evaluation and training
- Hospital information systems
- Remote evaluation and diagnosis
- Blending of public and private networks
- Remote database access
- Internet access and content filtering
- Training video on demand
